

Historical Tool Development Timeline – v1.0 to v4.8

A complete bullet-point summary of version progress from earliest traceable version to the current major version block (v4.8). This list highlights key structural milestones and phase shifts in the tool.

 **v1.0.0 → Initial Experiments** - Basic Betfair API integration: fetched markets, odds - Single-strategy logic hardcoded (lay favourite only) - No threading, no tiering system

 **v1.1.0 → Added Runners + Odds Tracking** - Added selectionId loop - Fetched odds for runners within markets - Stored odds in memory only (no DB)

 **v1.2.0 → Introduced SQLite Database** - Introduced `bets.db` and `odds_history` tracking - First anchor odds (OC0) logic added

 **v2.0.0 → Live Betting Engine Begins** - Core lay function added via test interface - Manual betting UI for early testing - Added threading for concurrent market monitoring

 **v2.2.0 → OC1-OC3 Tracking Introduced** - Odds Check system formalised (OC1 to OC3) - Stored OC odds to DB - Created range_low / range_high logic

 **v2.5.0 → Pattern Recognition Prototype** - Recognised drift/steam/tick trends - Simple blueprint match logic

 **v3.0.0 → Playbooks + Blueprint System** - Introduced `playbooks` table - Started blueprint construction via `OC0→OC1→...` - Match = Signal → Signal = Trade

 **v3.4.0 → Tiered Runners + Active Market Loop** - Separated active/passive/ignored runners - Started background scanner (evaluate_market_loop) - Added market lifecycle filtering (-15 to 90 min window)

 **v3.7.0 → Ingest Market Snapshot Pipeline** - Injected `ingest_market_snapshot()` - Unified runner data structure - Signals tracked through memory_write

 **v4.0.0 → Next-Gen Rewrite Begins** - Created signal_memory_engine.py - Formalised threading and memory syncs - Added tick trail, volatility

 **v4.2.0 → Unmatched Signal Tracker** - Introduced `unmatched_signals` memory - Used to track recent non-fired patterns

 **v4.5.0 → Ladder Trading & Playbook Matching** - Added live ladders for each runner - Opened/closed playbooks with PnL

 **v4.6.0 → Full Blueprint Matcher with Confidence** - Used confidence + direction to rank signals - Began adaptive staking logic

 **v4.7.0 → Snapshot Logging + Daily Report** - Enabled daily signal status summary - Synced memory read/write snapshots - Enabled daily playbook save + restore

 **v4.8.0 → Co-op Scalper Engine + PnL Tracker** - Core integration with `scalper_module.py` -
Added live scalp ladder execution - Added memory injection of all scalping signals

Let me know if you'd like each version expanded into its own sub-canvas or exported for version-tagging.
